RE: Theresa and Robert Owens

Dear Anne:

I saw the above patient about a month ago for their problem of primary infertility. Theresa is DES exposed as you know and, indeed, she has a small T-shaped uterus by UTG which is a text book example of a hypoplastic DES exposed uterus. Sperm function appears normal so I strongly suspect that this infertility is DES related.

My experience with DES patients is not particularly good in that assisted reproductive technologies are not as effective on these people as they are in other patients with female factors. This may be due to the large miscarriage and ectopic rate or may be just due to unknown factors.

Nevertheless, we must proceed in the same way since there is no other way to go in that the primary defect (uterine hypoplasia) cannot be corrected. In that regard I am going to meet with them to discuss diagnostic laparoscopy or assisted reproductive technology and I will, as always, keep you posted.

Sincerely,

Merle J. Berger, M.D.
